

Troubleshooting for Error Messages

Why is my image not displayed in my social media posts?

You have shared your blog post with Blog2Social on social media, but the image is missing or the post has not been published because of an image issue?

In these cases, you will receive an error message like this:

-> "Your post could not be posted, because your image is not available or the image source does not allow to publish."

-> "The image in your post is unavailable, not publicly accessible, or does not meet the required size or format."

We've created a general checklist which shows you the most common issues and solutions.

Checklist

- [Is your image in ".jpg" or ".png" format?](#)
- [Does your image have the optimal size?](#)
- ["Page Not Found" Errors](#)
- [Is your image blocked by Hotlink Protection or Firewalls?](#)
- [Are your Open-Graph-Tags set?](#)
- [Is your hosting provider blocking your images for security reasons?](#)
- [Does your website meet the system requirements?](#)

Is your image in ".jpg" or ".png" format?

We recommend using ".jpg" or ".png" images because they're supported by all social media networks. Please make sure to avoid using ".webp" image formats since those are not supported by each network.

There are also optimisation plugins (such as "W3 Total Cache" or "WP-Optimize - Clean, Compress, Cache") that automatically convert your image to ".webp" format, which can lead to problems when posting. It is therefore advisable to also check the settings of the optimisation plugins you are using.

Please note:

There may be issues if your image file ends in ".jpg" or ".png" but is actually a "webp" image. You can check this by opening the image URL in your browser and then downloading it.

Troubleshooting for Error Messages

Does your image have the optimal size?

If your image is too large or too small, your image will not be displayed.

[Overview of the best image sizes](#)

Please ensure your **Google Business** post image is **at least 10 KB (10,240 bytes)** to guarantee successful publishing.

"Page Not Found" Errors

If your posts are missing images or displaying "**Page not found**" link descriptions, and you use SiteGround or Wordfence, please check the following settings:

For SiteGround Users

- Go to your WordPress Dashboard and navigate to **SG Security -> Site Security**.
- Locate the **Automated Bot Protection** section.
- If enabled, add **facebookexternalhit** to the allowlist (whitelist).
Alternatively, temporarily disable this feature to see if it resolves the issue.

For Wordfence Users

- Navigate to **Wordfence -> All Options**.
- Open the **Advanced Firewall Options**.
- Ensure the box "**Allow documented Google/Bing/Facebook crawlers to bypass the firewall**" is checked.

Is your image blocked by Hotlink Protection or Firewalls?

If an image is blocked by hotlink protection or firewalls, neither Blog2Social nor the social media networks can access the image's URL. As a result, your post may not be published, or it may be published without the image.

Firewall settings

If you use an additional Firewall like Wordfence, please make sure that your settings allow outgoing connections or include an exception for Blog2Social. You could also try whitelisting Blog2Social since proper access could be blocked by installed security plugins or additional firewalls on the server-side as well. If you are using security plugins or server sided settings please try to whitelist your own server IP as well in order to allow automatic curl processes if you face any issues. You may also try to unblock our IPs if required.

What is Hotlink Protection?

The most common reason for this error message is Hotlink Protection. Many WordPress websites use a Cloudflare installation or other plugins with an activated Hotlink Protection.

Hotlinking describes the embedding of external images or videos on your own website. A Hotlink is generated, for instance, if somebody visits your website and shares one of your videos or images on his own website or on social media. Social networks and third-party tools like Blog2Social use Hotlinks to display your images in the post preview correctly. Hotlink Protection blocks this option and prevents you and your social media community of this option to share your images, your infographics, or your videos across the internet.

How to check your website for Hotlink Protection

To check, if your website or your images are blocked by Hotlink Protection, you can use the following tools:

Option 1: Hotlink-Checker

[Free-Webhosting](#) offers such a service for free. You can check the URL of your image to see if your image is blocked by Hotlink Protection. Just make sure to clear the cache of your browser (press ctrl + F5 in your open browser window) before you do the check!

Option 2: Blog2Social Troubleshooting Tool

You can use the [Blog2Social Troubleshooting Tool](#) in the Blog2Social dashboard. The protocol will show you if your website has activated Hotlink Protection.

How to deactivate Hotlink protection?

Option 1: Uninstall or deactivate all activated plugins for Hotlink Protection or deactivate the Hotlink Protection settings in your plugins. If you are not sure which of your plugins enable Hotlink Protection, you can find [some example plugins in the WordPress.org directory](#).

Option 2: Select your „htaccess“-directory, check on the following entries and delete them if necessary:

Troubleshooting for Error Messages

- RewriteEngine on
- RewriteCond %{HTTP_REFERER} !^\$
- RewriteCond %{HTTP_REFERER} !^http(s)?://(www\.)?yourdomain.com [NC]
- RewriteRule \.(jpg|jpeg|png|gif)\$ - [NC,F,L]
- RewriteRule .*\. (jpe?g|gif|bmp|png)\$ - [F]

These entries might prevent third-party sites and services like social networks and Blog2Social from accessing your images and videos.

Are your Open-Graph-Tags set?

Open-graph tags are parameters in the HTML code of your website that enable the social media network to identify a specific image, title, and description that will be displayed in the link preview. In order to ensure your blog posts are displayed correctly on social media, it is necessary to make sure, the Open-Graph-Tags (og) are set correctly in the metadata of your blog post.

[What are open graph tags and what do I use them for?](#)

[Troubleshooting: Checklist and solutions for setting Open Graph Tags](#)

You can easily check the meta-data of your URL yourself. Call up the URL of the post that has been published without an image and right-click on the page. Then click on: "Show page information".

Copy the link of the og:image into a separate tab to see which og:image is set. More information about Social Meta Tags.

Your og:image is not available or there are duplicate og:images available?

This can be due to the use of other plugins that set og:image tags. If these tags are set twice, some social media networks, such as Facebook, will not be able to read the data and your image will not be displayed. Since Blog2Social can also set these tags for you, you don't need any other plugins to set open graph tags.

How do I set Open Graph tags with Blog2Social?

There are several ways to set Open Graph tags in the metadata of your website, as well as there are tools to help you do this. The easiest and most efficient way is to set your Open Graph tags using the social media automation plugin Blog2Social. To let Blog2Social set the meta tags for you, simply check the Meta Tags boxes in your setting and then click on "save". You can find them in: Blog2Social -> Settings -> Social Meta Data

Troubleshooting for Error Messages

Do you use a plug-in that sets the image tags automatically?

Please note that you should only use one plugin to set your meta tags. In this case, please deactivate the additional plugin, otherwise, the social media networks will not know which meta tags to use. If you use other plugins that set tags for you, your post will be displayed without an image.

Have you defined a specific image as featured image for your post?

Also, make sure that there is always a picture for your blog posts in WordPress. Blog2Social will automatically use this image as og:image.

Is your hosting provider blocking your images for security reasons?

In rare cases, it's possible that your hosting provider might block social media networks from accessing your images. This could happen, for instance, if Facebook frequently requests to retrieve the image from your post.

Please check this with your provider and ensure that your images are accessible.

Does your website meet the system requirements?

We will keep our tool up to date for you. Update Blog2Social by clicking on "**Plugins**" -> "**Installed Plugins**" in your WordPress dashboard.

Please make sure that the latest version of Blog2Social is installed on your website and that your website meets the [system requirements](#).

The fast performance and page-load of your website is a necessary requirement for social media to access and display your posts and images. Huge image sizes can slow down the page speed tremendously so that the social media cannot access your image at the time of posting so that your image will not be displayed in your post, or your post is rejected.

You can test the page speed of your website with Page Speed Checkers or Network-Tools like Traceroute or Ping. You will find more information and useful tools in the system requirements for installing Blog2Social.

To test, if the networks can access your post or image at all, you can also check the URL of your post with the following tools:

- [Facebook Sharing Debugger](#)
- [LinkedIn Post Inspector](#)
- [Twitter Card Validator](#)
